

During Q1 of fiscal year 2010 SAFE released build 3.000. This release included 107 "calls" most of which were bug fixes. Some of what was included:

- The Customer Directory search was re-engineered to use web services directly from PowerBuilder. Previously, a CD engine on a separate server handled this.
- The separate SAFE Lite application was merged directly into SAFE. SAFE Lite is an application used by the help desk for various administrative tasks.
- The SAFE/CARE interface was updated to include Termination of Parental Rights (TPR) and attorney information. Workers will no longer need to manually enter this information since it will be coming directly from the courts.
